

Prince Ude

📍 Lagos, Nigeria ✉ ude.princedev@icloud.com 🌐 in/prince-ude 📄 ude-p.github.io

SUMMARY

Backend and infrastructure engineer specializing in Go, Linux systems, Kubernetes, and high-performance realtime networking. Focused on low-allocation runtimes, telemetry ingestion pipelines, observability, and scalable backend infrastructure running on self-managed Linux environments.

SKILLS

Languages

Go, SQL, Bash

Infrastructure & Operations

Kubernetes, Docker, Linux, Docker Compose, Github Actions, Caddy

Databases & Messaging

PostgreSQL, TimescaleDB, Redis, NATS

Networking

gorilla/websocket, Protocol Buffers, TCP/WebSocket

Observability & Performance

OpenTelemetry, OTel Collector, Grafana Cloud, Pyroscope, Pprof

EXPERIENCE

Backend and Infrastructure Engineer

WHOT Studios

February 2024 - Present, Abuja, Nigeria

- Built the realtime networking layer in Go using gorilla/websocket for player synchronization and room state fan-out across gameplay infrastructure serving 600k+ users.
- Managed rooms sustaining hundreds of concurrent websocket clients with high-frequency snapshot broadcasting and protobuf-go-lite serialization.
- Reduced websocket allocation pressure and broadcast overhead through runtime profiling using pprof and Pyroscope.
- Built asynchronous backend workflows using NATS for gameplay events and internal service messaging.
- Managed Linux production workloads using Docker Compose, GitHub Actions deployment pipelines, shell rollout scripts, and Caddy reverse proxy infrastructure.
- Instrumented backend services with OpenTelemetry, OTel Collector, Grafana Cloud, and runtime profiling dashboards.
- Worked with Kubernetes environments for deployment rollouts, ingress configuration, service networking, and cluster operations.
- Built internal operational tooling and dashboards using Go templ and htmx.

Systems Reliability Engineer

Gtrac Services Ltd

August 2022 - February 2024, Lagos, Nigeria

- Built and maintained backend services supporting realtime GPS tracking, telemetry ingestion, geofencing, alerts, and fleet reporting workflows.
- Maintained telemetry ingestion infrastructure processing location updates from 7k+ concurrently online vehicles.
- Built TimescaleDB/PostgreSQL ingestion pipelines for high-volume telemetry and time-series tracking data.
- Managed Linux-based production systems running containerized backend services, Caddy reverse proxy infrastructure, and Docker networking.
- Automated deployments using GitHub Actions and remote Linux rollout scripts.
- Built monitoring dashboards and telemetry instrumentation using OpenTelemetry and Grafana Cloud.

PROJECT

Cash.io - Multiplayer Realtime Infrastructure

WHOT Studios · playcash.io

- Built authoritative multiplayer game servers in Go handling realtime synchronization and room-based gameplay state.
- Managed rooms sustaining 500-1000 concurrent players per node with high-frequency websocket snapshot fan-out.
- Reduced bandwidth and allocation overhead through protobuf-based snapshot serialization, with room tick p99 reaching ~42ms during heavy synchronization bursts.
- Profiled goroutine pressure, websocket backlog buildup, and serialization hotspots using Pyroscope and pprof.
- Used NATS for async communication between backend services and gameplay systems.
- Deployed workloads to Linux infrastructure using Docker Compose, GitHub Actions, OpenTelemetry, Grafana Cloud, and runtime profiling tooling.

Routenex

www.routenex.com

- Built backend services for realtime GPS tracking, geofencing, alerts, and fleet telemetry ingestion handling millions of telemetry writes into TimescaleDB/PostgreSQL and Redis-backed realtime systems.
- Managed containerized Linux workloads across self-hosted infrastructure using Docker, Kubernetes deployment environments, Caddy, and container networking.
- Integrated SMS and email notification systems for operational alerts and driver activity events.
- Automated deployments, observability, and service monitoring workflows using GitHub Actions, OpenTelemetry, and Grafana Cloud.

KubeOps

WHOT Studios

- Built Go-based Kubernetes operational tooling for workload deployment, runtime inspection, rollout diagnostics, and cluster event debugging.
- Wrote reconciliation workflows using controller-runtime for rollout validation and service health verification.
- Built OpenTelemetry collection pipelines for centralized metrics, tracing, and workload visibility.
