SUMMARY

Backend and Infrastructure Engineer working with Go, Kubernetes, and Linux. I build backend services, Kubernetes operators, and tools for deploying and running applications on Kubernetes.

SKILLS

Core: Go, Kubernetes, Linux, PostgreSQL

Kubernetes: controller-runtime, client-go, CRDs, Operators, k3s, Cilium, Longhorn, Helm

Infrastructure: Ansible, ko, GitHub Actions, GHCR, OpenTelemetry, Grafana

Networking: HTTP, TCP, UDP, WebSockets, gRPC, Protocol Buffers

Cloud: AWS EKS, EC2, ECS, Fargate, ALB

EXPERIENCE

Backend and Infrastructure Engineer

02/2024 – Present | Abuja, Nigeria

WHOT Studios

- Built Go backend services serving 600k+ players, including game servers supporting 500 to 1,000 concurrent players per node with approximately 42ms p99 tick latency.
- Migrated production workloads from single server deployments to self managed k3s clusters, automated cluster setup with Ansible, and configured Cilium networking and Longhorn distributed storage.
- Built and operated services using WebSockets, gRPC, NATS, PostgreSQL, and Redis, with OpenTelemetry and Grafana for monitoring and tracing.

Systems Reliability Engineer

08/2022 – 02/2024 | Lagos, Nigeria

Gtrac Services Ltd

- Maintained systems processing realtime location updates from 3.5k+ concurrently online vehicles.
- Built backend services and PostgreSQL/TimescaleDB ingestion pipelines for GPS telemetry, geofencing, alerts, and fleet reporting.
- Managed Linux servers running containerized services, Caddy, and Docker networking, with deployments automated through GitHub Actions.

PROJECTS

appd — Kubernetes Deployment CLI 🔗

- Built appd, a Go CLI that deploys Kubernetes workloads from a single HCL resource instead of maintaining separate Kubernetes manifests.
- Built the Kubernetes operator behind appd using controller-runtime and client-go, with a custom CRD that reconciles Deployments, StatefulSets, Services, Jobs, ConfigMaps, Ingresses, and Namespaces.
- Added drift detection, resource pruning, variable substitution, rollout health checks, and integration with External Secrets Operator and Vault.
- Used ko and GHCR to build and publish Go services as part of the deployment workflow. The operator has been running in production across multiple services for 4+ months.

Cash.io — Multiplayer Backend 🔗

- Built multiplayer game servers in Go with room lifecycle management, state synchronization, WebSockets, and Protocol Buffers.
- Profiled goroutine pressure, WebSocket backlogs, allocations, and serialization using Pyroscope and pprof.

Routenex — Fleet Tracking 🔗

- Built GPS tracking and telemetry services backed by PostgreSQL, TimescaleDB, and Redis, deployed on a self hosted k3s cluster.
